1 Introduction

1.1 Motivation

According to a survey in Germany, nine out of ten companies (89 percent) analyze large volumes of data from a variety of different sources for operational decision-making processes using modern Big Data Analytics Applications, where 48 percent of the respondents see the greatest potential of Big Data [Jör14a]. The analysis of continuous data streams is taking up a growing importance for companies and therefore constitutes an important factor for business success.

Collecting, storing and analyzing system and operational data of Big Data Applications is therefore an essential tool in order to ensure successful operation. Even though logfiles are useful for tracing problems in software systems, problems can be tracked and potential sources of error can be identified much earlier by collecting and storing execution and service data at runtime to describe the state of the system at a given point in time.

Due to the distributed character of Big Data Applications, where a system is composed of several interacting components, the examination of log data is not an adequate choice to gain insight into an entire system [Les14].

TODO: Was ist der Markt?

1.2 Objective

The main goal of the thesis is the design and implementation of a software system to ingest and store system and operational data of Big Data Analytics Applications on

the example of the streaming frameworks Apache Flink and Apache Kafka. It should be examined which data is available and can be collected at all, what data is relevant and how to collect from source systems. Furthermore, the collected data must be stored in a persistence system to become available for possible consumers like visualization applications, analytical processes or as a data source for applications from the context of Machine Learning for example.

TODO: Eher Forschung oder eher Anwendung? Was machen Sie nicht? Und warum haben Sie sich entschieden das nicht zu machen.

1.3 Structure of thesis

After a short introduction to the topics and the main goals of the present thesis in this chapter, the Chapter 2 covers the theoretical foundations of Big Data Analytics Applications, discusses the concept of "stream-processing" and introduces Apache Flink and Apache Kafka as representatives of widely used stream-processing frameworks.

Chapter 3 investigates which sources for collecting data exist for Apache Flink and Kafka and which data should be collected and stored in a persistence system regarding to its relevance and data quality.

The requirements and the target definition of the software-system will be introduced in Chapter 4, Chapter 5 describes the software solution by giving a detailed conceptional overview of the software components and providing implementation details for selected items.

In chapter 6 we'll see how to setup the technical environment for the usage of the prototype to verify the correct functionality related to the requirements defined in Chapter 4.

The last Chapter 7 covers a conclusion and summary of the present work.

1.4 Summary

2 Theoretical Foundations

After a short introduction to the terminology of Big Data, this chapter will discuss the main characteristics of Big Data Analytics Applications and introduces the concept of stream processing, which is one of the main characteristics of the popular streaming frameworks Apache Flink and Apache Kafka. The underlying concepts both of these systems and how they're used in context of Big Data Analytics will be explained at the end of this chapter.

2.1 Big Data

According to [Nat15] the term “Big Data” is a misleading name since it implies that pre-existing data is somehow small, which is not true, or that the only challenge is the sheer size of data, which is just one of them among others. In reality, the term Big Data applies to information that can't be processed or analyzed using traditional processes or tools.

In the past decade the amount of data being created is a subject of immense growth. More than 30,000 gigabytes of data are generated every second, and the rate of data creation is only accelerating.[Nat15]. People create content like blog posts, tweets, social network interactions, photos, servers continuously log messages, scientists create detailed measurements, permanently.

Through advances in communications technology, people and things are becoming increasingly interconnected. Generally referred to as machine-to-machine (M2M), interconnectivity is responsible for double-digit year over year (YoY) data growth rates. Finally, because small integrated components are now affordable, it becomes possible to add intelligence

to almost everything. As an example, a simple railway car has hundreds of sensors for tracking the state of individual parts and GPS-based data for shipment tracking and logistics.[Ziko12]

Besides the extremely growing amount of data, an increase in data diversity goes hand in hand. It comes in its raw and unstructured, semistructured or structured form, which makes processing it in a traditional relational system impractical or impossible. In [Jör14b] is described, that around 85 percent of the data comes in an unstructured form, but containing valuable information.

Big Data is defined by three characteristics:[Nat15]

Volume The amount of data present is growing because of growing amount of producers, e.g. environmental data, financial data, medical data, surveillance data.

Variety Data varies in its form, it comes in different formats from different sources.

Velocity Data needs to be evaluated and analyzed quickly, which leads to new challenges like analysis of large data sets with answers in seconds range, data processing in realtime and data generation and transmission at highspeed.

Figure 2.1: The three 'V's of Big Data[Ziko12]

A possible definition for Big Data could be derived as follows:

"Big Data refers to the use of large amounts of data from multiple sources with a high processing speed for generating valuable information based on the underlying data."

2.2 Big Data Analytics Applications

Big Data Analytics describes the process of collecting, organizing and analyzing large volumes of data with the aim to discover patterns and other useful information extracted from incoming data streams [Nat15]. The process of analytics is typically performed using specialized software tools and applications for predictive analytics, data mining, text mining, forecasting and data optimization.

The areas of applications may be extremely diverse and ranges from analysis of financial flows or traffic data, processing sensor data or environmental monitoring.

2.3 Stream Processing

According to [Kle16], stream processing is the real-time processing of data continuously, concurrently, and in a record-by-record fashion in which data is treated not as static tables or files, but as a continuous infinite stream of data integrated from both live and historical sources.

Check [Nat15] S.225 ff.

Benefits of stream processing:

- Accessibility: live data can be used while still in motion, before being stored.
- Completeness: historical data can be streamed and integrated with live data for more context.
- High throughput: high-velocity, high-volume data can be processed with minimal latency.

2.3.1 Apache Flink

2.3.2 Apache Kafka

2.4 Summary

3 Data Analysis

3.1 System data

3.2 Java Management Extensions (JMX)

3.3 Representational State Transfer (REST)

3.4 Data Quality

3.5 Summary

4 Requirements

TODO: Based on the topic of this, three main components. Describe general. see [Les14]

4.1 Collection

4.2 Transport

4.3 Persistence

4.4 Summary

realtime?

5 Architecture

Welche Teilprobleme leiten sich aus der Zielstellung weiter ab? Was sind die Rahmenbedingungen für die Probleme und wie können wir diese lösen.

Lösungsbeschreibung, warum so?

Bauen Sie auf der Methodik aus der Einführung auf. Ein System bauen und dann beobachten (machen Sie tests)

z.B. wenn Sie ein System bauen. Wie sieht Ihre Architektur aus? Was sind die Resultate des Entwurfs? Welche Alternativen gibt es zu Ihrem Entwurf? Warum haben Sie sich gerade für Ihre Lösung entschieden? Was sind deren Vor und Nachteile?

Welche Prozesse unterstützt die Architektur? Datenquellen? Transformationen? Datenverarbeitung?

5.1 Collected data as time-series based stream

TODO see [Kle16]

5.2 Microservices and Service-Discovery

TODO

5.3 System components

TODO maybe split Infrastructure / Software components

5.3.1 CollectorClient

The CollectorClient tier is our entry point for bringing data into the system...

5.3.2 Service-Discovery

Registration for CollectorClients

5.3.3 CollectorManager

Gives overview, uses Consul as service-discovery

5.3.4 Message-Broker

Transport, "Event-Log", see [Kre13]

5.3.5 Indexer

Receive messages from Kafka, route data, create ES index, why, describe context BDAA

5.3.6 Persistence

ES as search index for time-series based data, easy visualization with Kibana, why?

5.4 Summary

Maybe Spring alternatives, Lagom, VertX, Play? Maybe collector as agent instead of microservice, alternatives REST, maybe (Web-)Sockets

6 Implementation

Introduce software stack

6.1 The "collect"-algorithm

Eigenschaften des Algorithmus, Komplexität, Wie gehen Sie vor?, Beschreiben Sie was wann passiert

Java8, CPs, non-blocking streams

7 Evaluation

TODO intro

TODO Aufbau der Messumgebung, see docker-deploy

Server/Betriebssystem etc., Datensätze, Anfragen, Systeme/Ansätze gegen die Sie sich vergleichen, Wie messen Sie? Methodik und Maßeinheiten?

7.1 Local test envirenment

7.2 Docker environment

7.3 Observations

7.4 Discussion

Wurden Sie überrascht? Stimmt Ihre Hypothesen? Sind Sie besser, anders als das andere System? Wichtigster Erkenntnisgewinn 1 Wichtigster Erkenntnisgewinn 2 Wichtigster Erkenntnisgewinn N Anwendbarkeit? Szenario?

7.5 Summary

Beschreibung der Ergebnisse, Diagramme, Darstellen von Zusammenhängen

8 Conclusion

TODO

8.1 Summary

Was war die Zielstellung? Wie war unsere Vorgehensweise? Konnten wir das Problem/die Probleme lösen? Wichtigste Erkenntnisgewinne?

8.2 Outlook

Was würden Sie an dem Thema machen wenn Ihnen jetzt jemand die nächsten drei Jahre finanziert? Was würde Google / Oracle / IBM machen? Sollten wir eigentlich solche Dinge, die Sie in Ihrer Arbeit machen, auch wirklich erforschen oder bauen? Wer verliert dadurch, wer gewinnt?
